

## Outflow from black hole accretion flow

Feng Yuan (Shanghai Astronomical Observatory)

Although the fatal gravity of the black hole, a very fraction of the accretion flow will turn their direction during the accretion and become into outflow. There are two kinds of outflow, one is episodic jet, another is wind. In this talk, I will review the study of episodic jet and wind, including the observational evidences, formation mechanism, and properties of outflow. Many of these studies are performed by MHD numerical simulations.
